antidiabetic, antipyretic, dermatological, cardiovascular, nephrotropic and auditory activities, and can be used as a natural amyloid aggregation (inhibitor and a neurotoxicity inhibitor of natural beta amyloid peptide (beta-Ap). (I) are used in the manufacture of a medicament for the diagnosis or treatment of an amyloidogenic disease e.g. Alzheimer's disease and other clinical occurrences of beta amyloid deposition such as comorrhage with amyloidosis, and for treating a myloid deposition such as amyloidosis such as familial amyloid polymeuropathy. (I) reduces the amyloidosis such as familial amyloid polymeuropathy. (I) reduces the amyloidosis such as familial amyloid polymeuropathy. (I) reduces the concity of natural beta-AP aggregates to cultured neuronal cells. (I) cont only reduces the formation of neurotoxic aggregates but also have the ability to reduce the neurotoxicity of performed A-beta fibrils. The company of the present a beta-AP peptide, which is used in the company of the present invention
                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          familial amyloid polyneuropathy; cardiomyopathy; systemic senile amyloidosis; bovine spondyform encephalopathy; creutzfeldt-Jakob disease; Gerstmann-Straussler-Scheinker syndrome; diabetes; insulinoma; myeloma; Sjogren's syndrome; familial mediterraneam fever; urticaria; deafness; hereitaly cerebral haemorthage; heemodialysis; thyroid; renal amyloidosis; lysozyme-associated hereditary systemic amyloidosis; beta-amyloid peptide; human.

```
The invention relates to amyloidogenic proteins or peptide fragments aggregation modulators. The invention is used for treating disorder associated with amyloidosis, particularly familial amyloid oblyneuropathy (C ansociated with amyloidosis, particularly familial amyloid cardiomyopathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (C famish type), isolated cardiac amyloid, systemic senile amyloidosis, corapie, bovine spongiform encephalopathy, Creutzfeldt_Jakob disease, CC Gerstmann-Straussler-Scheinker syndrome, adult onset diabetes, amyloidosis, myeloma or macroglobulinemia-associated amyloidosis, primary coralized cutaneous nodular amyloidosis, idiopathic (primary) amyloidosis, familial Mediterranean Fever Syndrome, reactive (secondary) amyloidosis, familial Mediterranean Fever and familial amyloid nephropathy with urticaria and deafness (Mucklericalary correptant) hereditary cerebral heemorrhage with mayloidosis of Finnish type, amyloidosis of polyneuropathic systemic amyloidosis of Finnish type, amyloidosis of Finnish type, amyloidosis of Finnish type, amyloidosis corained with medulialary carcinoma of the thyroid, fibrinogen amyloidosis and lysozyme-associated hereditary renal amyloidosis and lysozyme-associated hereditary systemic control of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cerebrovascular disease; cardiovascular disease; memory loss; anxiety;

forms of amyloid precursor proteins comprising from the 5' to the 3' end a sequence encoding a marker and either (1) a sequence encoding the N-terminus of an amyloid precursor protein (APP) up to, but not including, the nucleotides encoding the beta amyloid protein (BAP) domain or (2) the BAP domain; or the two ligated together, can be used to detect drugs or compounds that inhibit/augment the activity of proteolytic enzymes which cleave APP to generate BAP fragments (deposition of which occurs in patients with Alzheimesa disease and Down's syndrome). This is a fragment of amyloid precursor protein containing a mutation which is associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant polypeptides produced using the coding sequences of mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nootropic; neuroprotective; antifibrillogenic; amyloidosis inhibition; cytoprotection; amyloid deposit degradation; amyloidosis disorder; Alzheimer's disease.

The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's
disease comprises contacting blood vessel wall cell with amyloid-beta 40
                                                                                                                                               Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Amyloid-beta40 inhibitor; Abeta40 inhibitor; cerebral amyloid angiopathy; CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease; cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide #20, used as carrier for the amyloid-beta40 (Abeta40) inhibitor.
                                                           Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.
                                                                                                                                                                                                                                                                                                 Score 30; DB 4; Length 9;

The present invention describes a method (MI) for analysing cleavage of a CC polymer. MI comprises: (a) providing a sample of the polymer, a portion composition on the polymer molecules having been labeled at a position on ne side of the polymer molecules having been labeled at a position on the opposite composition on the polymer molecules having been labeled at a position on the opposite the potential cleavage site with a second isotopic label; (b) side of the potential cleavage site with a second isotopic label; (b) concubating the sample under conditions suitable for cleavage at the conditions suitable for cleavage at the conditions suitable for cleavage at the conditions suitable for analysing hether and/or where cleavage has taken place. MI is useful for analysing cleavage of a where the polymer, where is a linear polymer, and comprises a peptide composition, whethods from the present invention can be used in discovering or protein. Methods from the present invention can be used in discovering conditions improved synthetic substrates for both known and unknown enzymes, conseruit to identify new substrates for enzymes, in screening methods are also conserved in the sequence origin, and in screening methods conserved inherities, in in vivo/ex vivo/in vitro peptide, and in assaying methods for coligonucleotide or peptide sequencing and in measuring differential
                                                                                                                                                                                                                                                                                      ö
can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral haemorrhage with amyloidosis of the Dutch type and haemorrhagic stroke. The present sequence represents one of a group of peptides (AAUI1648-AAUI1659, AAUI1919) & AAUI1611) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor was used in the invention to treat a disease state characterised by cerebral amyloid anglopathy (CAA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Analyzing cleavage of polymer, by providing polymer sample, incubating the sample with labeled isocope for cleavage at potential cleavage site, and analyzing the masses of any uncleaved fragments by mass spectrometry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mass spectrometry; polymer; analysis; cleavage; substrate specificity; isotope; protease.

The invention describes an isolated inhibitory peptide (I) which interacts with a hydrophobic beta-sheet forming cluster of amino acid residues on a protein or peptide for amyloid -like deposit formation, and inhibits or structurally blocks the abnormal folding of proteins and peptides into amyloid or amyloid-like deposits and into pathological beta-sheet-rich conformation. (I) is useful for disorders or diseases associated with abnormal protein folding into amyloid or amyloid-like deposits, such as Alzheimer's disease, Down's syndrome, other amyloidosis disorders, human prion diseases, such as kuru, Creutzfeldt-Jakob disease (CDD), Gerstmann-Straussler-Schainker syndrome (GSS), prion associated human neurodegenerative diseases as well as animal prion diseases such as crapie, spongiform encephalopathy, transmissible mink encephalopathy and chronic wasting disease of mule deer and elk. (I) is also useful for detecting and diagnosing the presence or absence of amyloid or amyloid-
                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Amyloid formation; amyloid-like deposit; Alzheimer's disease; pathological beta-sheet-rich conformation; Down's syndrome; amyloidosis disorder; human prion disease; kuru; CJD; Creutzfeldt-Jakob disease; Gerstmann-Straussler-Scheinker syndrome; GSS; prion associated human neurodegenerative disease; animal prion disease; scrapie; spongiform encephalopathy; transmissible mink encephalopathy;

The invention relates to a method for prevention and/or treatment of an amploid-related disease which comprises administration of an all-D - amyloid-beta peptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and tavours the clearance of soluble amyloid-beta in a mammal and the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including inflammatory diseases e.g. rheumatoid arthritis, juvenile chronic arthritis, ankylosing spondylitis, psoriasis, psoriatic arthropathy, Reiter's syndrome, Adult Still's disease, Bechet's syndrome and Crohn's disease. AA deposits are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus culcers, chronic pyelonephritis, osteomyelitis and Whipple's disease). Certain malignant neoplasms can also result in AA fibril amyloid deposits
                                                                                                                                                             ö
like deposits in vivo and its precursors. This is the amino acid sequence of peptide associated with the inhibition of amyloid or amyloid like

The invention relates to inhibitory peptide comprising a portion of at least three amino acid residues and a sequence predicted not to adopt a beta-sheet structure that associates with a hydrophobic beta-sheet cluster on a protein or peptide involved in the abnormal folding into a beta-sheet structure, to structurally block the abnormal folding into a protein or peptide. The inhibitory peptide is useful for preparing a composition for preventing, treating or detecting disorders or diseases associated with amyloid-like fibril deposits e.g. Alzheimer's disease and prion related encephalopathies. The invention is also useful in gene therapy. The present sequence is a peptide used in the invention
                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New inhibitory peptide, useful for preparing a composition for diagnosing, preventing or treating disorders associated with amyloid-like fibril deposits, e.g. Alzheimer's disease, or prion related
including Hodgkin's lymphoma, renal carcinoma, carcinomas of gut, lung and urogenital tract, basal cell carcinoma and hairy cell leukaemia. The present sequence is an Abeta peptide used to illustrate the method of the

The present invention describes an isolated amyloid beta peptide or its chomologue which is selected by a method comprising: (a) determining the homologue which is selected by a method comprising: (a) determining the binding value of each amino acid of a myloid beta peptide companies to a Hind class I and/or class II molecule of interest; (b) determining the resulting score of all amino acids of the subsequence, cased on the binding value of each amino acids obtained in step (1); and comparing the resulting score to a preselected value. Also described: (c) comparing the reaction of each amino acids obtained in step (1); and correct comprising the isolated amyloid beta peptide and a carrier or diluent; (2) determining T-cell epitopes within amyloid beta peptide: (3) predicting the reaction of an individual to a vaccine; (4) matching a composition of an individual based on the HLA haplotype of the individual; (5) a kit for matching a vaccine comprising amyloid beta peptide to an individual based on the HLA haplotype of the individual; (c) and (d) preventing the formation or progression of amyloid plaques. The amyloid beta amyloid beta peptide is useful for preparing a composition comprises. The amyloid beta amyloid beta peptide is useful for preparing a composition of preventing the formation or progression of amyloid plaques for preventing the formation or progression of amyloid plaques for preventing or treating Alzheimer's disease. The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) as second agent (a2) that is: (i) a peptide or peptidenimetic that modulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation, or (ii) an immune system modulator that prevents or inhibits amyloid-beta fibril formation, or corropic, neuroprotective, cerebroprotective, haemostatic, opothalmological, antithyroid, vasotropic, cardiovascular, tranquilliser, uropathic, anticonvulsant, anti-HIV, antiparkinsonian, muscular, ouropathic, anticonvulsant, anti-HIV, antiparkinsonian muscular, cardiorist, anticonvulsant, endocrine and hypnotic activities, and can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an amyloid-beta related disease e.g. Alzaheimer's disease (including sporadic (non-hereditary) or familial (hereditary)), mild cognitive impairment, amyloid angiopathy, hereditary perebral hemorrhage, senile dementia, correction, or a condition associated with Alzaheimer's disease (including hypothyroidism, cerebral hemorrhage, cardiovascular disease, memory loss, anxiety, a behavioural dysfunction (e.g. Huntington's aggression, or incontinence), a neurological condition (e.g. Huntington's

disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (Foreceptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1.5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1.3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The Alzheimer's disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAB46225
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         유
                                                                                                                                                                        The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that a second agent (a2) that is: (i) a peptide or peptidomimetic that a second agent (a2) that is: (i) a peptide or peptidomimetic that a second agent (a2) that is: (i) a peptide or peptidomimetic that characteristic or therapeutic immune response against amyloid-beta fibril formation, or induces a prophylactic or (ii) an immune system modulator that prevents or inhibite amyloid-beta fibril formation modulators. (c) have not that indiconvolamet, antichyloid-beta fibril formation modulators, and as immune system modulators. (c) can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (c) can be used as myloid-beta fibril formation modulators, and as immune system modulators. (c) can be used for preventing or treating an amyloid-beta related disease e.g. Altheimer's disease (including sporadic for myloid-beta related disease e.g. Altheimer's disease (including sporadic myloid-beta related disease e.g. Altheimer's disease (including sporadic myloid-abety) or mid cognitive impairment, vascular dementia, complexed, and anyloid-abety disease, and as anyloid-abety disease, and as anyloid-abety, a meurological condition escalar disease, amyotrophic lateral solerois, acquired immunodeficiency, disease, mony loss, anxiety, a behavioural dysfunction (e.g. dputhing of sease, amyotrophic lateral solerois, acquired immunodeficiency, extrasion, and sease, apparation, extrasion, allocation, extrasion, and proposition, extral disorder, weight condition in anyloid precursor protein gene, an antificial myloidosis inhibiting apeptide can be used as an antifibration and proper proper protein 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 30; DB 8; Length 9; Pred.                                                                                                                                           This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein chepp. Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (For receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 chabeta, or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Amyloid deposit; APP; Abeta; brain; human; clearing response; nootropic; Fc receptor mediated phagocytosis; immunogenic response; neuroprotective; amyloid precursor protein; Alzheimer's disease.
                                              Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises

administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (Fc receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have noortropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The methods are useful for prophylactic and therapeutic treatment of Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abera fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (FC receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta, or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific

It is based on a portion of cother amyloid related disorders in humans. It is based on a portion of inserting 1 or more amino acid residues or by substituting 1 or more amino acid residues or non-amino acid tragments. Vaccines of the invention acid residues or non-amino acid conjudes synthesised from the unnatural D-configuration amino acids to solid the drawbacks of 'self' proteins. The all-D peptides need not be avoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. The petides need not be captagated to be operative or immunogenic. The peptides need not be all-D fortein conjudates, immunogenic derivative peptides and corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and corresponding to residues peride and the all-D derivative peptides or new amyloid beta peptide and the all-D derivative peptides or preventing fibrillogenesis and associated cellular toxicity. The amyloid preventing fibrillogenesis and associated cellular toxicity. The amyloid crelated diseases may be localised amyloidosis, e.g. diabetes type II, neurodegenerative diseases, scrapie, cerebral amyloid angiopathy, and creuzfeldt-Jakob disease, scrapie, cerebral amyloidosis associated with

The invention relates to an amyloid-targeting imaging agent comprising an amyloid targeting moiety, a linker moiety and a labelling moiety. The agent is of general formula A.L.(A.L. B. B. D. (I) where z=0. I, A.L. an amyloid targeting molety, A.L. B. T. B. Inker moiety, and A.L. a. b. a labelling moiety. A.Lso included are imaging amyloid deposition or diagnosing an amyloid-related condition in a patient involving administering (I) to the patient, and ultrasound imaging (I) in the patient to determine the presence of amyloid or amyloid-related condition; and a kit for preparing a radiopharmaceutical preparation comprising (I) a reducing agent, a buffering agent, a transchelating agent, and instructions for the preparation and use of the radiopharmaceutical in the imaging of amyloid or an amyloid-related condition. The agents are used for imaging amyloid deposition and for diagnosing an amyloid related
                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New amyloid-targeting imaging agents useful for in vivo imaging amyloid plaques and/or for the treatment of amyloidosis disorders.
chronic infection (e.g. tuberculosis) or chronic inflammation (e.g. rheumatoid arthritis), familial Mediterranean fever (FMF) and systemic amyloidosis found in long-term haemodialysis patients
                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Amyloid; imaging agent; Creutzfeldt-Jakob disease; Kuru; CJD; transmissible cerebral amyloidosis; transmissible virus dementia; scraple; transmissible mink encephalopathy; BSE; type II diabetes; bovine spongiform encephalopathy; inflammation associated amyloid; primary amyloidosis; feline spongiform encephalopathy; Alzheimer's disease; prion-mediated disease; blood-brain barrier; dialysis-related amyloidosis; light chain-related amyloidosis; cerebral amyloid anglopathy.

The present invention describes a method (MI) for analysing cleavage of a polymer. MI comprises: (a) providing a sample of the polymer on one side of the polymer molecules having been labeled at a position on one side of the potential cleavage site with a first isotopic label and a portion of the potential cleavage site with a second isotopic label; (b) incubating the sample under conditions suitable for cleavage at the potential cleavage site with a second isotopic label; (b) incubating the sample under conditions suitable for cleavage at the potential cleavage site; and (c) analysing the mass(es) of any cleaved fragments by mass spectrometry and thereby determining whether and/or where cleavage has taken place. MI is useful for analysing cleavage of a polymer, where the polymer is a linear polymer, and comprises a peptide or protein. Methods from the present invention can be used in discovering new or improved synthetic substrates for both known and unknown enzymes, e.g. enzymes identified from the human genome. The methods are also useful to identify the sequence origin, and in screening methods to
condition e.g. Creutzfeldt-Jakob disease (CJD), kuru, transmissible cerebral amyloidoses (transmissible virus dementias), familial CJD, scraple, transmissible mink encephalopathy, bovine spongiform encephalopathy (BSE), inflammation-associated amyloid, type II diabetes, primary amyloidosis, feline spongiform encephalopathy, non-transmissible cerebral amyloidosis, Alzheimer's disease, prion-mediated diseases, dialysis errelated amyloidosis, light chain-related amyloidosis, cerebral amyloid angiopathy. The agents are capable of crossing the blood-brain barrier and are capable of binding specifically to amyloid plaques. The present sequence is a peptide forming the amyloid targeting moiety of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Analyzing cleavage of polymer, by providing polymer sample, incubating the sample with labeled isotope for cleavage at potential cleavage site, and analyzing the masses of any uncleaved fragments by mass spectrometry
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  spectrometry; polymer; analysis; cleavage; substrate specificity;

             libraries, in in vivo/ex vivo/in vitro peptide, and in assaying methods for oligonucleotide or peptide sequencing and in measuring differential protein expression. The methods are useful for monitoring the cleavage of polypeptides or polymucleotides, and for determining optimal polymer substrates. ABPS7505 to ABPS7605 represent peptides used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cerebral amyloid angiopathy; amyloid disease; ankylosing spondylitis; psoriasis; Reiter's syndrome; Adult Still's disease; Bechet's syndrome; Crohn's disease; infection; leprosy; tuberculosis; carcinoma; nootropic; chronic pyelonephritis; ostcomyellitis; Whipple's disease; vasotropic; Hodgkin's lymphoma; neuroprotective; bronchiectasis; ophthalmological; ulcer; antiinflammatory; cytostatic; uropathic; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method for prevention and/or treatment of an amyloid-related disease which comprises administration of an all-D-amyloid-beta peptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and favours the clearance of soluble amyloid-beta or fibril amyloid-beta from the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including inflammatory diseases e.g. rheumatoid arthritis, juvenile chronic arthritis, ankylosing spondylitis, posoriasis, psoriatic arthropathy, Reiter's syndrome, Adult Still's disease, Bechet's syndrome and Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         All-D-amyloid-beta peptide; Alzheimer's disease; rheumatoid arthritis;
                                                                                                                                                                                                                       Gaps

The present invention describes compositions (C) comprising: (a) a first cases of (a1) that prevents or treats amyloid-beta related disease; and (b) casecond agent (a2) that is: (i) a poptide or peptidomimetic that casecond agent (a2) that is: (ii) a poptide or peptidomimetic that conditions amyloid-beta fibril formation, or therapeutic immune septems modulator that prevents or inhibits amyloid-beta for it in immune system modulator that prevents or inhibits amyloid-beta notropic, neuroprotective, cardiovascular, tranquilliser, coptiballic, cardiant, antichyloid-beta fibril formation and pypnotic activities, on be used as amyloid-beta fibril formation and hypnotic activities, on the cardiovascular, antichyloid-beta fibril formation andulators, and as immune system modulators. (C) can be used for preventing or treating an immune system modulators. (C) can be used for preventing or treating an amyloid-beta related disease e.g. Alzheimer's disease (including sporadic condition associated with Alzheimer's disease (including sporadic amyloid-appthy, hereditary) or familial (hereditary), mild cognitive impairment, andulators, crebral haemorthage, senile dementia, compression, or a condition associated with Alzheimer's disease (including hypothyroidism, cerebrovascular disease, cardiovascular disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, agreases on the confinence), a neurological condition (e.g. apathy, disease, memory loss, anxiety, a behavioural dysfunction (e.g. Huntington's disease, memory loss, anxiety, abehavioural disturbance, transient ischaemic field deficits, incoordination, gardical condition, escapione, proteching anyloid-alse altered muscle forme, salarizes, sensory loss, anxiety appressed, or survober, transient alternal aspects, escaped, or survober, and anyloid-alse alternass, attention deficit, frequent falls, syncope, neuroleptic sensitivity, normal pressure hydrocephalus, subdidial identicin, depressed mood, irritability, anhedomina, social withdrawal, confidencion, depress behavioural dysfunction; neurological condition; psychological condition; Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator. Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.

Disclosure; Page 95; 143pp; English.

The present invention describes compositions (b) agent (al) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that a modulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation; or (ii) an immune system modulator that prevents or inhibits amyloid-beta fibril formation. Also described is a kit comprising (C). (C) have nootropic, neuroprotective, cerebroprotective, heamostatic, coptual antithyroid, vasotropic, cardiovascular, tranquilliser, uropathic, anticonvulsant, anti-HIV, antiparkinsonian, muscular, curopathic, anticonvulsant, anti-HIV, antiparkinsonian, muscular, and as induced as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an immune system modulators. (C) can be used for preventing or treating and immune system modulators. (C) can be used for preventing or treating and immune system modulators. (C) can be used for preventing or treating and anyloid-beta impairment, vascular dementia, cerebral amyloid angiopathy, hereditary cerebral haemorrhage, senile dementia, amyloid angiopathy, hereditary cerebral haemorrhage, senile dementia, degeneration, or a condition associated with Alzheimer's disease (including hypothyroidism, cerebrovascular disease, cardiovascular disease, cardiovascular disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, present invention describes compositions (C) comprising: (a) a first

```
aggression, or incontinence), a neurological condition (e.g. Huntington's disease, amyotrophic lateral sclerosis, acquired immunodeficiency, backinson's disease, aphasia, apraxia, agnosia, Pick disease, dementia with Lewy bodies, altered muscle tone, seizures, sensory loss, visual coordination, gait disturbance, transient ischaemic field deficits, incoordination, gait disturbance, transient ischaemic syncope, neurological esnsitivity, normal pressure hydrocephalus, subdural consactom, hallucination, sensitivity, normal pressure hydrocephalus, subdural consensor, hardination, serval discort, weight loss, psychosis, a sleep disturbance, insomnia, behavioural discinhibition, poor insight, suicidal ideation, depressed mood, irritability, anhedonia, social withdrawal, or excessive guilt)) in a subject e.g. human having a genomic mutation in an amyloid precursor protein gene, an ApoE gene, or a presentlin gene; having amyloid-beta deposite. The present sequence represents an amyloid-beta polymerisation peptide which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method has been developed for the prevention or treatment of a disorder or disease associated with the formation of amyloid or amyloid-like

deposits, involving the abnormal folding of a protein or peptide. The method involves administering an inhibitory peptide which prevents the abnormal folding or which dissolves existing amyloid or amyloid-like deposits, where the peptide comprises a sequence of 3-15 amino acid at least one of the 3 amino acids is a beta-sheet blocking amino acids cesidue selected from Pro, Gly, Asn and His. The present sequence cresidue selected from Pro, Gly, Asn and His. The present sequence crepresents an anti-amyloid peptide, Abeta, which inhibits abnormal crepresents an anti-amyloid peptide, and capable of associating with a structural determinant on the protein or peptide to structurally block and inhibit the abnormal folding into amyloid or amyloid-like deposits. The method can be used for preventing, treating or detecting e.g. The method can be used for preventing, treating or detecting e.g. Alzheimer's dementia or disease, bown's syndrome, other amyloidosis disorders, human prion diseases such as Kuru, Creutzfeldt-Jakob disease, cerstanann-StrausBeir-Scheinker Syndrome, prion associated human neurodegenerative diseases or animal prion diseases such as scrapie, spongiform encephalopathy, transmissible mink encephalopathy and chronic wasting disease of mule deer and elk

```
stabilises an I-helical conformation of a discordant helix in a polypeptide, particularly amyloid beta-peptide (Abeta). The method comprises providing a test sample comprising a polypeptide that contains a discordant helix in the form of an I-helix, contacting the test sample with a test compound and determining the rate of decrease in the amount of I-helix or the amount of I-helix present in the test sample. The method is useful for identifying a compound that stabilises an I-helical conformation of a discordant helix in a polypeptide. Such compounds are useful for decreasing the rate of formation of theta-strand structures between at least two discordant helix-containing polypeptides, and for treating amyloidogenic disorders such as amyloidosis in Alzheimer's disease, and prion diseases (e.g. scrapie, bovine spongiform encephalopathy (BSE), Creutzfeld-Jacob disease (CDD)). AAU99416 represent >9-residue discordant helical segments from various proteins

Determining secondary structure binding to desired targets within parent polypeptides that bind to targets, by constructing and complexing peptides to metal ions to form metallopeptides and screening the Determining secondary s netallopeptides.

Claim 194; Page 98; 165pp; English.

The invention relates to a method for identification and determination of target-specific folding sites in peptides and proteins. The invention also relates to a method for determining a secondary structure binding to desired targets within parent polypeptides that bind to targets, by constructing and complexing peptides to metal ions to form metallopeptides and screening the metallopeptides. The method is useful for determining secondary structure binding to desired target within parent polypeptide with primary structure that binds to the target, where

(I) is useful for disorders or diseases associated with abnormal protein folding into amyloid or amyloid-like deposits or into pathological beta-sheet-rich precursors of such deposits, such as Alzheimer's disease, Down's syndrome, other amyloidoists, such as Alzheimer's disease, Down's syndrome, other amyloidosis disorders, human prion diseases, such as Kuru, Creutzfeldt-Jakob disease (CJD), Gerstmann-Straussler-Scheinker syndrome (GSS), prion associated human neurodegenerative diseases as well as animal prion diseases such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Amyloid formation, amyloid-like deposit; Alzheimer's disease; pathological beta-sheet-rich conformation; Down's syndrome; amyloidosis disorder; human prion disease; kuru; CJD; cetuzfeldt-Jakob disease; Gerstmann-Straussler-Scheinker syndrome; GSS; prion associated human neurodegenerative disease; animal prion disease; scrapie, spongiform encephalopathy; transmissible mink encephalopathy; chronic wasting disease.
the target of interest is a receptor, antibody, toxin, enzyme, hormone, nucleic acid, intracellular protein domain of biological relevance or extracellular protein domain of biological relevance. A library of amyloid beta-protein related peptides is useful for the treatment of Albahamer's disease (AD). A library of peptides targetting vasopressin, oxytocin or angiotensin receptor is useful for treating prion's disease. The present sequence is an amyloid beta-protein related peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel inhibitory peptides which inhibit and structurally block abnormal folding of protein into amyloid or amyloid-like deposit and into pathological beta-sheet rich conformation, useful for treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to peptides having an aggrecanase cleavage site between a glutamic acid residue on the N-terminal side and a nonpolar or uncharged residue on the C-terminal side, and capable of being cleavable by aggrecanase-1 and/or aggrecanase-2. The peptides are useful as aggrecanase substrates in high-throughput screening assays for aggrecanase inhibitors as potential therapeutic compounds. The present sequence is a peptide substrate of human aggrecanase-1 and -2 proteins
           chronic wasting disease of mule deer and elk. (I) is also useful for detecting and disgnosing the presence or absence of amyloid or amyloid-like deposits in vivo and its precursors. This is the amino acid sequence of peptide associated with the inhibition of amyloid or amyloid like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptides useful as aggrecanase substrates in assays for aggrecanase inhibitors comprise an aggrecanase cleavage site between a glutamic acid residue and a nonpolar or uncharged residue.

The inhibitory peptide is useful for preparing a composition for preventing, treating or detecting disorders or diseases associated with amyloid-like fibril deposits e.g. Alzheimer's disease prion related encephalopathies. The invention is also useful in gene therapy. The present sequence is amyloid-beta (Abeta) peptide. This peptide is used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New inhibitory peptide, useful for preparing a composition for diagnosing, preventing or treating disorders associated with amyloid-like fibril deposits, e.g. Alzheimer's disease, or prion related

The invention relates to a method for prevention and/or treatment of an amyloid-related disease which comprises administration of an all-D-amyloid-beta peptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and favours the clearance of soluble amyloid-beta or fibril amyloid-beta from the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including inflammatory diseases e.g. rheumatoid arthritis, juvenile chronic arthritis, ankylosing spondylitis, psoriasis, psoriatic arthropathy, Reiter's syndrome, Adult Still's disease, Bechet's syndrome and Crohn's Gisease. AA deposits are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus ulcers, chronic pyelonephritis, osteomyelitis and Whipple's disease). Certain malignant neoplasms can also result in AA fibril amyloid deposits including Hodgkin's lymphoma, renal carcinomas of gut, lung and uroganital tract, basal cell carcinoma and hairy cell leukaemia. The invention and batta peptide used to illustrate the method of the
                                                                                 cerebral amyloid angiopathy; amyloid disease; ankylosing spondylitis; psoriasis; Reiter's syndrome; Adult Still's disease; Bechet's syndrome; Crohn's disease; infection; leprosy; tuberculosis; carcinoma; nootropic; chronic pyelonephritis; ostcompelitis; Whipple's disease; vasotropic; Hodgkin's lymphoma; neuroprotective; bronchiectasis; ophthalmological; ulcer; antiinflammatory; cytostatic; uropathic; therapy.
                                                             All-D-amyloid-beta peptide; Alzheimer's disease; rheumatoid arthritis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Prevention and/or treatment of an amyloid-related disease e.g. Alzheimer's disease, comprises use of all-D-amyloid-beta peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 30; DB 6; Length 12;

PEPTIDES AND PHARMACEUTICAL COMPOSITIONS
THEREOF FOR TREATMENT OF DISORDERS OR DISEASES ASSOCIATED
WITH PROTEIN FOLDING INTO AMYLOID OR AMYLOID-LIKE DEPOSITS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 5, Application US/09594366

Patent No. 6582945

GENERAL INFORMATION:
APPLICANT: RASO, Victor
TITLE OF INVENTION: IMMUNOLOGICAL CONTROL OF BETA-AMYLOID LEVELS IN VIVO
FILE REFERENCE: BERI-2004
CURRENT APPLICATION NUMBER: US/09/594,366
CURRENT FILING DATE: 2000-06-15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Sequence 3, Application US/09594366
GENERAL INFORMATION:
APPLICANT: Raso, Victor
TITLE OF INVENTION: IMMUNOLOGICAL CONTROL OF BETA-AMYLOID LEVELS IN VIVO
FILE REFERENCE: BBRI-2004
CURRENT APPLICATION NUMBER: US/09/594,366
CURRENT FILING DATE: 2000-06-15
PRIOR APPLICATION NUMBER: 60/139,408
PRIOR FILING DATE: 1999-06-16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                       AAW02310_W02332 represent the peptide portions of the beta-amyloid coding to the invention. Beta-amyloid peptide is a 4 modulator compounds of the invention. Beta-amyloid peptide is a 4 kilodalton peptide that is the major protein component of amyloid plaques are present both in the brain lesions, and in the walls of cerebral blood vessels in Alzheimer's disease patients. The the walls of cerebral blood vessels in Alzheimer's disease patients. The amyloid modulators of the invention comprise an amyloidogenic protein or peptide (such as this sequence) coupled directly or indirectly to at least one modifying group. The modifying group is preferably a cyclic, heterocyclic, or polycyclic group, such as declain, a cholanyl group, a bottin containing group, or a fluorescein containing group. These compounds then modulate the agracagation of these sequences to natural amyloid proteins or peptides when contexted with the natural amyloid proteins or peptides. The modulator compounds can be used in the treatment of disorders associated with the natural completed cardiac amyloidosis systemic senile amyloidosis, scrapie, collated cardiac amyloidosis systemic senile amyloidosis, scrapie, comburopathy with urticaria and deafiness, hereditary cerebral hamorrhage computed the protein or peptides and other types of amyloidosis. The modulators are also useful for the training and deafiness, hereditary cerebral hamorrhage contented anyloidosis, and other types of amyloidosis. The modulators are also useful for the training and performance and other types of amyloidosis. The modulators are also useful for the contents and performance and other types of amyloidosis. The modulators are also usefully
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; beta-amyloid peptide; Alzheimer's disease; amyloidogenic protein; aggregation; neurotoxicity; amyloidosis; Down's syndrome; cardiomyopathy; familial amyloid polyneuropathy; bovine spongiform encephalopathy; Creutzfeldt-Jakob disease; bAP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                      ŝ

The present invention describes beta-amyloid peptide (DAP) derivatives. The bAP derivatives inhibit aggregation of amyloidogenic proteins and peptides, specifically bAP, and their neurotoxicity, so are useful for treating and preventing any disease involving amyloidosis, specifically Alzheimer's disease but also Down's syndrome, familial amyloid polyneuropathy or cardiomyopathy, bovine spongiform encephalopathy and Creutzfeldt-Jakob disease. The bAP derivatives are also used to diagnose these diseases, in vitro or in vivo, by detecting binding of bAP to labelled bAP derivatives. Some bAP derivatives inhibit bAP aggregation even when bAP is present in molar excess. The present sequence represents a bAP derivative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nootropic, neuroprotective, antifibrillogenic, amyloidosis inhibition, cytoprotection, amyloid deposit degradation; amyloidosis disorder; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                       New peptide(s) derived from beta-amyloid peptide that inhibit amyloid aggregation - and neurotoxicity, specifically for treatment and prevention of Alzheimer's disease.
                                                                                                                                                       Kasman L, Musso G, Molineaux S, Benjamin H;

The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid protein
                                                                                                                                                                                                                                                                           for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
                                                            Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nootropic; neuroprotective; antifibrillogenic; amyloidosis inhibition; cytoprotection; amyloid deposit degradation; amyloidosis disorder; Alzheimer's disease.
                                                                                                                                                                                                                                                 Peptides AAB48474-B48496 are antifibrillogenic agents that can be used

The present sequence is tract of an arrive percent sequence in the present sequence is tract of the present sequence is tract of the present sequence is tract of the present sequence in humans. It is based on a portion of anyloid-beta peptide (see AABB2622), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues, or by substituting 1 or more amino acid residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' peptides synthesised from the unnatural D-configuration amino acid to avoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with a flast 1 region of a mamyloid protein, e.g. the beta-sheet region or adgregated to be operative or immunogenic derivative peptides and fragments, protein conjugates, immunogenic derivative peptides and immunogenic peptidoming site region, the amyloid-beta peptide and the all-D derivative peptides given immunogenic peptidoming to residues 1.42, 1.40, 1.35, 1.28, 1.7, 10.16, 16-21 and corresponding to residues late and the all-D derivative peptides given in AABB2623.64. The vaccine elicits a preferential TH-2 or TH-1 response, preventing fibrillogenesis and associated cellular toxicity. The amyloid related diseases may be localised amyloidosis, e.g. diabetes type II, neurodegenerative diseases, e.g. bovine spongiform encephalitis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes an amyloid modulator comprising an amyloidogenic protein and/or peptide fragment coupled to a modifying group so that the compound modulates the aggregation of natural amyloid proteins or peptides. The modulator is used for treating a disorder associated with amyloidosis e.g. familial amyloid polyneuropathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (Danish type),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Beta-amyloid; amyloid modulator; amyloidogenic protein; amyloidosis; familial amyloid cardiomyopathy; isolated cardiac amyloid; systemic senile amyloidosis; scrapbe; myeloma; bovine spongiform encephalopathy; BSE; Creutzfeldt-Jakob disease; adult onset diabetes; Gerstmann-Straussler-Scheinker syndrome; insulinoma; atrial amyloidosis; idiopathic amyloidosis; haemodialysis; primary localised cutaneous nodular amyloidosis; sociated amyloidosis; hereditary cerebral haemorrhage with amyloidosis; Sjogren's syndrome; hereditary non-neuropathic systemic amyloidosis; Muckle-Wells syndrome; hereditary non-neuropathic systemic amyloidosis;
Creutzfeldt-Jakob disease, scrapie, cerebral amyloid angiopathy, and prion protein related disorders, or systemic amyloidosis associated with chronic infection (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) or chronic inflammation (e.g. amyloidosis found in long-term haemodialysis patients. The present all-beptide was demonstrated to elicit antibody production in rabbits, and provided greater anti-fibrillogenic activity than its all-L equivalent
                                                                                                                                                                                                                                Gaps

isolated cardiac amyloid, systemic senile amyloidosis, scrapie, bovine spongiform encephalopathy, Creutzfeldt-Jākob disease, adult onset diabetes, Gerstmann-Straussler-Scheinker syndrome, insulinoma, isolated cartial amyloidosis, idiopathic (primary) amyloidosis, melona or actrial amyloidosis, primary localised cutaneous condular amyloidosis associated with Sjogren's syndrome, reactive codular amyloidosis, familial Mediterranean Fever and familial emyloido nephropathy with urticaria and deafness (Muckle-Wells syndrome), hereditary cerebral haemorrhage with amyloidosis of Icalandic type, hereditary cerebral haemorrhage with amyloidosis of Icalandic type, amyloidosis associated with long term haemodialysis, hereditary non-europathic systemic amyloidosis of the thyroid, familial amyloid polyneuropathy (III), familial amyloidosis of the thyroid, fibrinogen associated hereditary carcinoma of the thyroid, fibrinogen associated hereditary crean amyloidosis. The compound is capable of altering and inhibiting beta-amyloidosis. The compound is capable of altering and inhibiting beta-amyloidosis. The contacted with a molar excess amount of natural beta-Aps cerelative to the modulator. This sequence represents a fragment of the Application of the an amyloid modulator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Amyloid modulator compound useful for treatment of an amyloidogenic disease such as Alzheimer's disease comprises an aggregation core domain and a modifying group attached to it.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                             intidabetic, antipyretic, dermatological, cardiovascular, nephrotropic, antidabetic, antipyretic, dermatological, cardiovascular, nephrotropic, and dantidabetic, antipyretic, dermatological, cardiovascular, nephrotropic, and auditory activities, and can be used as a natural mayloid aggregation; inhibitor and a neurotoxicity inhibitor of natural beta amyloid aggregation; cheara-Ap). (I) are used in the manufacture of a medicament for the diagnosis or treatment of an amyloidospanic disease e.g. Alzheimer's clisease and other clinical occurrences of beta amyloid deposition such as Down's syndrome individuals and in patients with hereditary cerebral amyloidosis with amyloidosis, and for treating a disorder associated with amyloidosis, and for treating a disorder associated with amyloidosis undid polyneuropathy. (I) reduces the control beta-Ap aggregates to cultured neuronal cells. (I) not only reduces the formation of neurotoxic aggregates but also have the ability to reduce the neurotoxicity of performed A-beta fibrils. The present sequence represent invention control of the present invention.
                                                                                                                                                                                                                                                                                                        ö
                        The present invention describes an amyloid modulator compound (I) comprising an aggregation core domain and a modifying group attached to
                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to an amyloid-targeting imaging agent comprising an amyloid targeting moiety, a linker moiety and a labelling moiety. The cagent is of general formula A.L.(A.l.n.K.z.A.l.n.B. a.b.l.a.b.l.) where z = 0 - 1; C. A.L. a mayloid targeting moiety. Also included are Imaging amyloid deposition or diagnosing an amyloid-related condition in a patient involving administering (I) to the patient. Also included are Imaging amyloid deposition or camarisating (I) to the patient. Of amyloid or amyloid related condition or administering (I) to the patient. A man dutrasound imaging (I) in the patient to determine the presence of amyloid or amyloid-related condition. C. and a kit for preparation and use of the radiopharmaceutical in instructions for the preparation and use of the radiopharmaceutical in creptaing agent, a buffering agent, a transchelating agent, and instructions for the preparation and use of the radiopharmaceutical in credit of amyloid or an amyloid-related condition. The agents are used for imaging amyloid deposition and for diagnosing an amyloid related condition e.g. Creutzfeldt.Jakob disease (CUD), kuru, transmissible creapain amyloidoses (transmissible virus dementiae), familial CUD, creapain amyloidoses (transmissible virus dementiae), familial CUD, creapain amyloidosis, feline spongiform encephalopathy, non-transmissible creapable, prinary amyloidosis, feline spongiform encephalopathy, non-transmissible creapable of primary amyloidosis, light chain-related amyloidosis, parents are capable of crossing the blood-brain character and are capable of binding specifically to amyloid plaques. The greent sequence is a peptide forming the amyloid cargeting moiety of the consent sequence is a peptide forming the amyloid diagoses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; islet amyloid polypeptide; IAPP; antifibrillogenic; amylin;
fibrillar accumulation; amyloidosis; diabetes; cytoprotection; nootropic;
chronic infection; tuberculosis; inflammation; rheumatoid arthritis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 fever; neurodegenerative disease; scrapie; neuroprotective; antipyretic; bovine appongy form encephalitis; Creutzfeldt-Jacob disease; amyloid-beta; Alzheimer's disease; cerebral amyloid angiopathy; anti-diabetic; tuberculostatic; antiarthritic; antirheumatic; cerebroprotective.
New amyloid-targeting imaging agents useful for in vivo imaging amyloid plaques and/or for the treatment of amyloidosis disorders.

The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral myloid angiopathy, particularly Alzheimer's disease, hereditary cerebral. The present sequence represents one of a group of peptides (AAU11648-AAU11669, AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The 'Abeta40 inhibitor was used in the invention to treat a disease state characterised by cerebral amyloid angiopathy (CAA)
                                 The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral amyloid hemorrhage with amyloidosis of the Dutch type and haemorrhagic stroke. The present sequence represents one of a group of peptides (AAU11648-AAU11659, AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor was used in the invention to treat a disease state characterised by cerebral amyloid angiopathy (CAA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's disease comprises contacting blood vessel wall cell with amyloid-beta 40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Amyloid-beta40 inhibitor; Abeta40 inhibitor; cerebral amyloid angiopathy; CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease; cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide #3, used as a carrier for amyloid-beta40 (Abeta40) inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                               Length 6;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          8
                                                                                                                                                                                                 The present invention relates to antifibrillogenic agents (ABB83281-ABB83298), derived from human islet amyloid polypeptide (IAPP, ABB83307).

The present sequence is a peptide fragment of the amyloid-beta (Abbeta) peptide. Aggregation of IAPP, also known as amylin, or Abeta results in ceptides prevent fibril formation and amyloidosis. The antifibrillogenic peptides prevent fibril formation and amyloidosis and hence control folding or deposition of amyloid proteins. The antifibrillogenic peptides of the invention are useful in the manufacture of a medicament for inhibiting or treating amyloidosis or amyloid deposits e.g. Type I and Type II diabetes and/or for cytoprotection. They are also useful for treating secondary amyloidosis associated with chronic infection e.g. tuberculosis and chronic inflammation e.g. rheumatoid arthritis, and familial inflammation, fever, neurodegenerative diseases e.g. scrapie, bovine spongy form encephalitis, Creutzfeldt-Jacob disease, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                           ద
                                                                                                                    ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method for prevention and/or treatment of an amyloid-related disease which comprises administration of an all-D amyloid-bet apoptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and cavours the clearance of soluble amyloid-beta or fibril amyloid-beta from the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including continuities, and varieties, juvenile chronic architis, and varieties, and crohn's carbuities, and varieties, psoriated architopathy, Reiter's syndrome, Adult Still's disease, Bechet's syndrome and Crohn's disease. AA deposits are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus ulcers, chronic pyelonephritis, ostcomyelitis and Whipple's disease).

Certain malignant neoplasms can also result in AA fibril amyloid deposits including Hodgkin's lymphoma, renal carcinoma, carcinomas of gut, lung and urogenital tract, basal cell carcinoma and hairy cell leukaemia. The

AA deposits are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus ulcers, chronic pyelonephritis, osteomyelitis and Whipple's disease). Certain malignant neoplasms can also result in AA fibril amyloid deposits including Hodgkin's lymphoma, renal carcinoma, carcinomas of gut, lung
present sequence is an Abeta peptide used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cerebral amyloid anglopathy; amyloid disease; ankylosing spondylitis; psoriasis; Reiter's syndrome; Adult Siill's disease; Bechet's syndrome; Corbn's disease; infection; leprosy; tuberculosis; carcinoma; nootropic; chronic pyelonephritis; osteomyelitis; Whipple's disease; vasotropic; Hodgkin's lymphoma; neuroprotective; bronchiectasis; ophthalmological; ulcer; antiinflammatory; cytostatic; uropathic; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method for prevention and/or treatment of an amyloid-related disease which comprises administration of an all-D - amyloid-beta peptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and arouns the clearance of soluble amyloid-beta or fibril amyloid-beta fro the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     peptide; Alzheimer's disease; rheumatoid arthritis;

The present interaction describes compositions (c) comparising; (a) a first agent (al) that prevents or treats amyloid-bet a related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that conducts a myloid-bet afibril formation or induces a prophylactic or therapeutic immune response against amyloid-bet alphylactic or therapeutic immune system modulator that prevents or inhibits amyloid-bet (ii) an immune system modulator that prevents or inhibits amyloid-bet (bbril formation) and fibril formation. Also described is a kit comprising (C). (C) have coortopic, neuroprotective, carebroprotective, haemostatic, tranquilliser, ophthalmological, antithyroid, vasotropic, cardiovascular, tranquilliser, ophthalmological, antithyroid, vasotropic, cardiovascular, cardionar, anti-HIV, antiparkinsonian, muscular, cordinar, antidebressant, endocrine and hypnotic activities, and can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an amyloid-beta related disease e. 3 Alzheimer's disease (including sporadic (non-hereditary)) or familial (hereditary), mild cognitive impairment, vascular dementia, cerebral complexity, hereditary cerebral haemostrabac, senile dementia, comyloid anglopathy, hereditary cerebral haemostrabac, senile dementia, comyloid anglopathy, hereditary cerebral haemostrabac, senile dementia, condition body myospitis, age-related manular cdisease, memory loss, anxiety, a behavioural dysfunction (e.g. Auntington's disease, amyloid-senitary) or anxiety, a behavioural dysfunction (e.g. Auntington's disease, amyloid-sease, aphasia, apraxia, agnosia, pick disease, dementia contition, allerness, actuares, sensory loss, visual field deficits incoordination gait disturbance, transient ischaemic cattack transient alertness, actures, sensor house, alertness, actual condition deficit, frequent falls, hammone, brain tumour, posttraumatic brain injury, or posthypoxis, or alloinestion, eastual diserder, weight loss, or st
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    illusion, hallucination, sexual disorder, weight loss, psychosis, a sleep disturbance, insomnia, behavioural disinhibition, poor insight, suicidal ideation, depressed mood, irritability, anhedonia, social withdrawal, or excessive guilt) in a subject e.g. human having a genomic mutation in an amyloid precursor protein gene, an ApoE gene, or a presentlin gene; having amyloid-beta deposite. The present sequence represents a peptide that can be used as a vaccine antigen in the exemplification of the

Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.

Disclosure; Page 69; 143pp; English.

The present invention describes compositions (C) comprising: (a) a first captured (ist) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidemietic that modulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation; or (ii) an immune system modulator that prevents or inhibits amyloid-beta for interperotective, haemostatic, cophthalmological, antithyroid, vasotropic, cardiovascular tranquilliser, uropathic, anticonvulsant, antidepressant, endocrine and hypnotic activities, and east a myloid-beta fibril formation modulators, and season and be used as amyloid-beta fibril formation modulators, and as a much beta disease (a) Alzheimer's disease (including sporadic (and-ob-beta related disease e). Alzheimer's disease (including sporadic (and-ob-beta related disease e). Alzheimer's disease (including sporadic (and-ob-beta related disease e). Alzheimer's disease (including propathy, hereditary or erebral hemorrhage, senile dementia, own's syndrome, inclusion body myositis, age-related macular (con-hereditary) or a condition associated with Alzheimer's disease.

Con-hereditary or a condition associated with Alzheimer's disease, monory loss, anxiety, a behavioural dysfunction (e.g. Huntington's disease, memory loss, anxiety, a behavioural dysfunction (e.g. Huntington's disease, memory loss, anxiety, a behavioural dysfunction (e.g. Huntington's disease, amyotrophic lateral sclerosis, acquired immunodeficiency, attack moders, incontinence), a neurological condition deficit, frequent falls, with Lewy bodies, altered mucole tone, seizures, sensory loss, altered mucole condition, beautiour, postraumatic brain influty, and deficits, feases, amyotrophic laderal aparticity, normal pressure dyscopenania, behavioural disinhibition, poor insight, suicidal disturbance

agent (a1) that prevents or compositives (a) comparishes, as a second agent (a2) that is: (i) a peptide or peptidemimetic that modulates amyloid-beta fibril formation or induces a prophylactic that medulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation; or fill an immune system modulator that prevents or inhibits amyloid-beta fibril formation. Also described is a kit comprisaing (C). (C) have nootropic, neuroprotective, crebroprotective, haemostatic, ophthalmological, antithyroid, vasotropic, cardiovascular, tranquilliser, uropathic, anticonvulsant, anti-HIV, antiparkinsonian, muscular, anticonvulsant, antidepressant, endocrine and hypnotic activities, and can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.

conditions that prevents or treates amyloid-beta related disease; and (b) a gent (al) that prevents or treates amyloid-beta related disease; and (b) a second agent (al) that prevents or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation; or therapeutic immune response against amyloid-beta fibril formation; or therapeutic immune system modulator that prevents or inhibits amyloid-beta fibril formation or induces a prophylactic or pottland in immune system modulator that prevents or inhibits amyloid-beta fibril formation modulators, and as modulators. (C) can be used as amyloid-beta fibril formation modulators, and as modulators. (C) can be used for preventing or treating an can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an exploid-beta fibril formation modulators, and as immune system modulators. (C) can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used as amyloid-beta fibril formation for treating or treating an exploid beta related disease e.g. Alzabamer's disease (induding sporadic (C) on the preditary or familial (Hereditary)), mild cognitive impairment, on condition associated with Alzabamer's disease. (Including hypothyroidism, creebral hamorrhage, senile dementia, nown's syndrome, including nowny loss, anxiety, a behavioural dysfunction (e.g. apathy, disease, amyotrophic lateral sclerosis, acquired immunodeficiency, alsease, amyotrophic lateral sclerosis, acquired immunodeficiency, cattack or stroke, transient alsease, sensory loss, usual tield deficits, incoordination, gait disturbance, transient lateral disturbance, transient alteral disturbance, psychological condition (e.g. depression, or a psychological condition, escapeute sorget pretain s
                                                                                                                                                                                                                                                                        Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                                                                                                   present invention describes compositions (C) comprising: (a) a first

The present libration describes compositions (v) compliance (v) dead to the present (a) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that conducted amyloid-beta fibril formation. or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation; or therapeutic immune response against amyloid-beta amyloid-beta fibril formation. Also described is a kit comprising (C). (C) have crebroprotective, haemostatic. (C) have nootropic, neuroprotective, cerebroprotective, haemostatic, cophthalmological, antithyroid, vasotropic, cardiovascular, tranquilliser, curopathic, anticonvulasmit, anti-HIV, antiparkinsonian, muscular, controleptic, cardiant, antidepressant, endocrine and hypmotic activities, and can be used as amyloid-beta fibril formation modulators, and as modulators. (C) can be used for preventing or treating an amyloid-beta related disease e.g. Alzheimer's disease (including sporadic (non-hereditary) or familial (hereditary)), mild cognitive impairment, amid-to-moderate cognitive impairment, vascular dementia, cerebral communication, or a condition associated with Alzheimer's disease (including hypothyroidism, cerebroular disease, memory loss, anxiety, a behavioural dysfunction (e.g. Huntington's aggression, or incontinence), a neurological condition e.g. Huntington's
